Chapter15-16, Serway; *ABSOLUTELY NO CHEATING!*

Please write down the answers on the blank space or on the back of this paper. Answer should be in english. [] indicates the question points.

Q1. (a) Write down the equation of motion (second order differential) for damping oscillation of a spring and its possible solution. (b) It is well known that most cars have the shock absorber used as a damped oscillator to balance the car while you travel through a zigzag path. For a strong jerking if the spring is in damped oscillation, calculate the frequency for that oscillation. Let the damping coefficient $b = 3\text{N}\cdot\text{s}/\text{m}$, the mass of the spring $m = 20\text{ kg}$ and spring constant $k = 2.0 \times 10^5\text{ N}/\text{m}$. [10+10+30=50]
(The question is similar to P.47 in Book)

Solution:

$$(a) \sum F_x = -kx - bV_x = ma_x$$

$$m \frac{dx^2}{dt^2} = -kx - b \frac{dx}{dt} \} \rightarrow (\text{damping term})$$

Possible solution is $x = Ae^{-\frac{b}{2m}t} \cos(\omega t + \phi)$

Where, A= Amplitude of wave , b=damping constant ,

ω = frequency of damping oscillation

(b) We know that,

$$\omega_0 = \sqrt{\frac{k}{m}} = \sqrt{\frac{2.0 \times 10^5}{20}} = 100\text{Hz}$$

With damping oscillation, the frequency is given by

$$\omega = \sqrt{\omega_0^2 - \left(\frac{b}{2m}\right)^2} = \sqrt{(100\text{Hz})^2 - \left(\frac{3\text{N}\cdot\text{m}/\text{s}}{2 \times 20\text{kg} - \text{s}}\right)^2} = 99.9 \square 100\text{Hz}$$

So the frequency will be , $f = \frac{\omega}{2\pi} = \frac{100}{2 \times 3.14} = 15.9\text{Hz} \square 16\text{Hz}$

Q2. (a) What is the difference between transverse and longitudinal wave? Give an example for each of the wave. (b) When you play a Guitar, you produce the transverse wave in the string. Suppose a string length is 1 m and for your plucking at the end of the string if a transverse pulse is produced and it makes 4 trips down and back along the string by 1s, what will be the tension in the string? Let the string has the mass of 0.2 kg. [10+10+ 30]
(Question is similar to P.25 in Book)

Solution:

(a) Transverse wave : The medium moves perpendicular to the traveling of the wave

Example : Guitar string wave , Ocean wave etc.

Longitudinal wave : The medium moves parallel to the traveling of the wave

Example : Sound wave , P-wave of earthquake

(b) The down and back distance is, $x = (1\text{ m} + 1\text{ m}) = 2\text{ m}$

So the speed of the wave is, $v = \frac{x}{t} = \frac{2}{1} = 2\text{ m/s}$

We know that the speed of standing wave on string is

$$v = \sqrt{\frac{T}{\mu}}, \quad \text{where } T = \text{tension produced at the end of string,}$$

$\mu =$ mass per unit length of string

$$\text{Therefore, } T = v^2 \times \mu = 2^2 \text{ m}^2 / \text{s}^2 \times 0.2 \text{ kg} / \text{m} = 0.8 \text{ N}$$
