

General Physics I, Midterm Exam 1 solution

1. (a) **The hawk's centripetal acceleration is**

$$a_c = \frac{v^2}{r} = \frac{(4.00 \text{ m/s})^2}{12.0 \text{ m}} = \boxed{1.33 \text{ m/s}^2}$$

- (b) The magnitude of the acceleration vector is

$$a = \sqrt{a_c^2 + a_t^2}$$

$$= \sqrt{(1.33 \text{ m/s}^2)^2 + (1.20 \text{ m/s}^2)^2} = \boxed{1.79 \text{ m/s}^2}$$

at an angle

$$\theta = \tan^{-1}\left(\frac{a_c}{a_t}\right) = \tan^{-1}\left(\frac{1.33 \text{ m/s}^2}{1.20 \text{ m/s}^2}\right) = \boxed{48.0^\circ \text{ inward}}$$

2.

This problem is from Page 201 (Example 7.9) of text book.

- (a) The separation of two atoms is where the potential is in its minimum. To find the

minimum, we set $\frac{dU(x)}{dx} = 4\epsilon \frac{d}{dx} \left[\left(\frac{\sigma}{x}\right)^{12} - \left(\frac{\sigma}{x}\right)^6 \right] = 4\epsilon \left[\frac{-12\sigma^{12}}{x^{13}} + \frac{6\sigma^6}{x^7} \right] = 0$

$$\frac{dU(x)}{dx} = 4\epsilon \frac{d}{dx} \left[\left(\frac{\sigma}{x}\right)^{12} - \left(\frac{\sigma}{x}\right)^6 \right] = 4\epsilon \left[\frac{-12\sigma^{12}}{x^{13}} + \frac{6\sigma^6}{x^7} \right] = 0, \quad x = (2)^{\frac{1}{6}} \sigma$$

- (b) Plug in numbers given, $x = 2.95 \times 10^{-10} \text{ m}$

(c) The potential energy curve is shown in page 189 of the text book.

- (d) When $x = 4.5 \times 10^{-10} \text{ m}$, the two atoms are subject to a restoration force to bring them together to the equilibrium point ($x = 2.95 \times 10^{-10} \text{ m}$)

- (e) This can be proved by taking the first derivative of the potential, $\frac{dU}{dx} > 0$, this is the force of the two atoms at that point, so it is a restoration force to bring them together.

3.

Parallel axis theorem

P10-7

$$I = I_{cm} + MD^2$$

$$I = \int r^2 dm$$

$$= \int (x^2 + y^2) dm$$

But $x = x' + x_{cm}$

$$y = y' + y_{cm}$$

$$\therefore I = \int [(x' + x_{cm})^2 + (y' + y_{cm})^2] dm$$

$$= \int (x'^2 + 2x'x_{cm} + x_{cm}^2 + y'^2 + 2y'y_{cm} + y_{cm}^2) dm$$

$$= \underbrace{\int (x'^2 + y'^2) dm}_{I_{cm}} + \underbrace{2x_{cm} \int x' dm}_{=0} + \underbrace{2y_{cm} \int y' dm}_{=0} + \underbrace{(x_{cm}^2 + y_{cm}^2) \int dm}_{D^2 M}$$

definition of center of mass

$$\therefore I = I_{cm} + MD^2$$

= Parallel axis theorem

4.

1) Perfect inelastic collision

$$m_1 v_{1i} + m_2 v_{2i} = (m_1 + m_2) v_f$$

$$v_f = \frac{m_1 v_{1i} + m_2 v_{2i}}{m_1 + m_2}$$

5.

$$\begin{aligned} W_{\text{on book}} &= (mg) \cdot \Delta r \\ &= (-mg\hat{j}) \cdot [(y_b - y_a)\hat{j}] \\ &= mgy_b - mgy_a \\ &= \Delta E_K \\ &= \Delta K_{\text{book}} \end{aligned}$$

$$\begin{aligned} mgy_b - mgy_a &= -(mgy_a - mgy_b) \\ &= -(U_f - U_i) \\ &= -\Delta U_g \end{aligned}$$

$$\therefore \Delta K = -\Delta U_g$$

$$\Delta K + \Delta U_g = 0$$
